

THE MODI TIMES

"All the evidence that's fit to print" · [INTERVIEW_DATE] · published once, on purpose

LOCAL BUILDER SHIPS SOLUTION COMPANY NEVER ASKED FOR, EXACTLY WHEN NEEDED

Raj Modi builds a fully functional financial-crime intelligence platform specifically for Wolters Kluwer, using AI tools, in [X] weeks — and brings receipts

ARTIST'S IMPRESSION: the architecture, if it were a skyline. Gold bridge = the hash chain.

WHAT INDUSTRY EXPERTS SAY

"Remarkable work. I checked for hardcoded numbers out of habit. There aren't any. I checked twice."

— Senior Developer, Imaginary Tech Weekly

"I've never seen an intern bring their own code review. I have now seen everything, and I am going home."

— Principal Architect, Made-Up Software Review

"Could revolutionize how interns present themselves. Please don't tell the other interns."

— HR Director, Fake Industry Observer

"The receipt made me laugh. The injection test corpus made me sit up. That's the correct order."

— Security Researcher, The Adversarial Gazette

NEWSROOM — Sources confirm the candidate read the FSS/FCC job description "like a crime scene," concluded that the industry's real constraint was defensibility, and proceeded to do something witnesses describe as "unusual": building the answer before the interview.

The resulting platform profiles any dataset on arrival, assembles an editable dashboard in seconds, scores transactions with a fraud model reporting honest held-out metrics (ROC-AUC 0.913 — "mid-table and proud," the builder insists), and dispatches an autonomous investigator whose every step is sealed in a SHA-256 chain.

When this reporter attempted to doctor one step of an investigation, the chain visibly snapped. The investigation, unimpressed, offered to re-run itself.

BY THE NUMBERS

82	automated tests, green in CI
284,807	real transactions in training
0.913	held-out ROC-AUC (honest)
11	flagship features, all shipped
0.36s	model warm-boot (was 21s)
6	SQL hypotheses per investigation
0	fabricated metrics, ever

"EVERY NUMBER SHOWS ITS WORK," INSISTS PLATFORM; AUDITORS SMITTEN

REGULATORY DESK — In a development industry observers call "long overdue," the platform's statistics arrive pre-confessed: each finding carries its formula, each forecast its backtest error, each model its evaluation discipline. The SQL console — sandboxed at the engine level — survived an adversarial corpus that famously caught a real vulnerability during development. "The tests attacked their own product," confirmed one onlooker. "It lost once. It will not lose that way again."

CAREERS DESK — Asked why the platform targets Wolters Kluwer specifically, the builder produced a document mapping every line of the job description to a shipped feature, then apologized for the document being "slightly out of date — two more features landed since printing." The hiring panel could not be reached for comment, being at press time in a room with the candidate. Early signals include, per witnesses, "at least one impressed eyebrow."
