WHY IT MATTERS

In financial crime & compliance, an AI that can't explain itself isn't a tool — it's a liability. Regulators don't accept "the algorithm said so." Verita is built for that constraint: every metric carries its formula, every model reports honest held-out error, and the AI investigation arrives sealed — re-runnable by anyone, tamper-evident to everyone. Auditability isn't a feature here. It's the architecture.

And it maps to your JD line by line — dashboards, forecasting, hypothesis testing, NLP, GenAI, SQL, datamarts: every keyword has a shipped feature behind it (JD_FEATURE_MAP.md in the repo).

THE STACK

Python · FastAPI · pandas
scikit-learn · SciPy · DuckDB
PostgreSQL · Docker · CI/CD
React 18 · TypeScript · ECharts
Three.js · Prometheus · Grafana
GenAI: Gemini w/ honest fallback

sha256 chain: each step's hash folds in the last — the signature move, and the thesis

TRY IT IN 60 SECONDS

```
$ git clone github.com/rajmodi262/verita
$ start.bat # one click: both servers, zero config
then drop ANY csv — including one of yours
```

*"Others promised.
I shipped — for you, specifically."*

this page is yours to keep · every claim on it is verifiable from the repo · corrections welcomed, genuinely

EVERY NUMBER SHOWS ITS WORK.
