foundation smoke test

Verita is a **FastAPI** + **React** platform that **scores** transactions for fraud with real **scikit-learn** models, runs a **DuckDB SQL** engine, and **seals** every investigation in a **SHA-256** hash chain. On a dark band the accent flips: **MCP Claude Code**.

honest metrics

*“Every auto-generated number shows its formula; every agent decision shows its query — then the trace is sealed in a tamper-evident chain.”*

— Verita design thesis

**💡 Insight:** PR-AUC is the headline for fraud because positives are **0.17%** of the data — ROC-AUC alone flatters the model.

**⚠️ Note:** This is a smoke test — numbers shown are the project’s real held-out figures, not placeholders.
