

VERITA

Financial Crime & Compliance Intelligence

Upload any financial dataset and, in seconds, get a dashboard that explains your data, a fraud-risk score for every transaction, and a sealed report a regulator could check.

A working product — not a résumé.

Raj Modi · built for Wolters Kluwer · June 2026

01 The problem it solves

A compliance analyst opens a file with hundreds of thousands of transactions. Before they see a single useful insight, an hour is gone just setting up charts. And when they finally spot something suspicious, they hit a wall that is unique to finance:

“You cannot act on a number you cannot explain to a regulator.”

So two costs pile up, every single day:

Lost time — the first hour vanishes before any answer appears.

No trust — a number you can't defend is a number you can't use.

Verita was built to remove both. The rest of this story is simply: *how*.

02 So, what is Verita?

In one sentence: **Verita turns any financial dataset into an instant, trustworthy report.** You drop in a file, and it does three things for you at once —

No BI tool to learn, no black boxes, no waiting. The promise underneath all of it is a single rule that runs through the whole product:

Every number it shows, it can prove.

That one rule is what makes Verita usable in compliance, where “trust me” is never a good enough answer.

03 Three things, each done well

Verita is really three tools that share one file and one principle. Here is what each one does, in plain terms:

The Auto-Dashboard

Drop in a file and get a polished, business-grade dashboard in seconds — the charts an analyst would have built, without the hour of setup.

The Fraud Engine

Scores every transaction for fraud risk using real machine learning — and, crucially, shows *why* each one was flagged, in language a person can act on.

The Investigator

An AI that investigates the data on its own, writes up what it found, and then seals the report so no one can quietly change it afterwards.

04 How it works, start to finish

From the moment you drop in a file to the moment you have a defensible answer, Verita moves through five clear steps. You can follow the whole journey at a glance:

The key is the order. Most tools stop at step three — they hand you a score and ask you to trust it. Verita keeps going. **Steps four and five — explain, then seal — are the whole point.** They turn a number into something you can put your name on.

05 Why this one is different

Most analytics tools are “black boxes.” They give you an answer and ask you to trust it. Verita’s rule is the opposite —

THE OLD WAY

“Here’s a number.
Trust me.”

VERITA

“Here’s a number —
and here’s the proof.”

Click any figure and it shows the exact formula behind it. Every AI decision shows the question it asked the data. And the whole investigation is sealed, so nothing can be changed after the fact. The project’s spine is one promise:

Every number shows its work.

It also tells you what it *can’t* do. On real fraud data — **284,807** actual transactions — it catches fraud with honest, measured accuracy, and openly lists its own limits. That honesty is the feature.

06 Why it fits — and who built it

Verita wasn't built in general. It was built against the Wolters Kluwer FCC Data Science role, point by point:

- Forecasting** → predicts trends and shows how accurate it was
- Fraud & AML detection** → real machine learning, with honest results
- Working with data & SQL** → a built-in query engine and auto-profiling
- Reporting** → instant dashboards, PDF exports, an audit trail
- Regulatory rigour** → sealed, reproducible, no invented numbers

Who built it

I didn't send a list of skills — I built the thing the role is about. I taught myself the full stack, designed the “every number shows its work” principle, and shipped a real, working product. Every claim in this story is something I can sit down and demonstrate.

07 The first 90 days

If you hire me, here is how I'd start — the same way I built Verita: learn it deeply, own a piece end to end, then make it production-grade.

LEARN

days 1–30

Get fluent in the stack, the data, and the regulations.
Ship a first owned report and ask a lot of questions.

OWN

days 31–60

Take a real model or forecast from raw data to a defended, documented result — the way Verita was built.

HARDEN

days 61–90

Make it production-grade: monitor for drift, capture analyst feedback, and write the limitations down.

I came with a solution, not a CV.

Let's build the next version together. — Raj Modi
